Erin,
Here is LPD's response:

DEQ's understanding is that EPA will be sampling private water wells as part of EPA's continuing remedial investigation efforts for the Wilcox Superfund site. This may occur next week depending on EPA's field schedule. DEQ's understanding is that EPA will be checking wells for any potential contamination related to former refinery operations. EPA has told us that they will be in Bristow working this week and next week.

DEQ's understanding is that EPA has walked Sand Creek and sampling of the Creek will occur as part of the remedial investigation at a later date.

DEQ's understanding is that EPA is still waiting for the results of recent soil gas sampling from their laboratory.

Thanks!
Amy

I'm hearing that you're back doing testing of water wells in Bristow, OK. What specifically are you checking for and why? What else, specifically, are you doing there, and how long do you think you'll be there? Have you checked the nearby creeks nearby yet and done any testing on them - specifically Sand Creek? Do you have the soil samples results from the most recent testing you've done on the site?
Thank you.
Janna Clark
